

# OCUFLOX

---

Ofloxacin

Ocuflox is the brand name of a prescription medication called ofloxacin ophthalmic solution. It is an antibiotic eye drop used to treat eye infections caused by susceptible bacteria. Ofloxacin is a fluoroquinolone antibiotic that works by inhibiting the growth of bacteria.

Ocuflox is commonly prescribed for conditions such as conjunctivitis (pink eye) and corneal ulcers.

## DRUG USES

Ocuflox is primarily used to treat and manage various eye infections caused by susceptible bacteria. Some common uses of Ocuflox include:

**Bacterial Conjunctivitis (Pink Eye):** Ocuflox is often prescribed to treat bacterial conjunctivitis, a common eye infection characterized by redness, itching, discharge, and discomfort in one or both eyes. It helps eliminate the bacteria causing the infection and alleviates the associated symptoms.

**Corneal Ulcers:** Corneal ulcers are open sores on the cornea, typically caused by bacterial infections. Ocuflox can be used to treat these infections to prevent them from spreading and causing further damage to the eye.

**Bacterial Keratitis:** Bacterial keratitis is an infection of the cornea that can result from injury, contact lens use, or other factors. Ocuflox may be prescribed to treat this condition and prevent vision-threatening complications.

**Prevention of Post-Surgery Infections:** In some cases, Ocuflox may be used prophylactically (as a preventive measure) to reduce the risk of bacterial infections following eye surgery, such as cataract surgery.

It's important to note that Ocuflox is specifically designed for bacterial eye infections and will not be effective against viral or fungal eye infections.
